Over half of individuals are more afraid of contracting COVID-19 than suffering a heart attack or stroke.¹

Emergency Room visits are down 42%².
More than 1 in 4 adults experiencing a heart attack or stroke would “rather stay at home than risk getting infected with COVID-19 at the hospital,” and these concerns are higher in diverse populations.³
Fewer Black and Hispanic individuals believe their "hospital would give me the same quality of care that they give everyone else." ³
Only about half of surveyed adults said they would call 911 first if they thought they were having a heart attack or stroke. ³
Background & Objectives

Background
The Don’t Die of Doubt campaign follows a 2014-2015 campaign AHA’s Southwest Affiliate conducted in Dallas, supported by the Caruth Foundation. The campaign had a positive impact on the public’s intent to call 911 and perceived trust in emergency medical professionals’ quality of care.

2020 Campaign Objectives
• Elevate awareness of the benefits of getting immediate care for heart attack or stroke despite fears of COVID-19
• Drive website engagement by providing AHA resources for the most prevalent underlying conditions for prevention and management.

2020 Research Objectives
• Provide insights regarding consumer concern about this issue
• Measure change in awareness of the benefits of getting treatment for heart attack and stroke despite COVID-19 fears; measure change in comfort level with calling 911 and going to the hospital
Methodology

Omnibus Online Survey:
Pre- and post-campaign online survey with Harris On Demand consumer panel

Timing
Pre-campaign
5/29/20 – 5/31/20
Post-campaign TBD

Sample
National sample of 2,050 adults, representative of U.S.

This report compares the general population sample with the campaign target audience of adults aged 35+ and at-risk or CV/stroke patients. Specifically, 41% of the sample (n=833) reported the following conditions:

- 34% high blood pressure
- 31% high cholesterol
- 14% diabetes
- 12% obesity
- 4% previous heart attack
- 4% previous stroke
- 4% atrial fibrillation
- 4% coronary artery disease
- 3% heart failure
- 3% vascular problems
- 2% heart valve problems
- 1% reported having had COVID-19

Note: Asterisk throughout (*) means a statistically significant finding.
KEY FINDINGS

Among 35+ at-risk age group
The non-COVID-19 findings track with the AHA’s 2014-15 Heart Attack/Trust Survey, Dallas County, results: Intent to take an aspirin first (13%) Cost (12%) Embarrassment (11%)
Most at-risk adults 35+ believe that hospitals are safe places. However, 4 in 10 say they would be scared to go to the hospital if they thought they were having a heart attack or stroke because they might get infected with COVID-19. And 1 in 4 would rather stay home.

### Agreement 4-point Scale

**Q5 To what extent do you agree or disagree with each of the following statements?**
Worry About Infection
3 in 4 at-risk adults 35+ express some degree of worry (a lot or a little) about getting infected with COVID-19 if they went to the hospital for any reason. 1 in 4 worry a lot about it.

Q6 Please tell us the extent to which you worry about getting infected with Coronavirus/COVID-19 if you went to the hospital for the following reasons.

<table>
<thead>
<tr>
<th>Reason</th>
<th>Not at all</th>
<th>A little</th>
<th>A lot</th>
<th>A lot / a little (net)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Medical Emergency</td>

Base: Total Sample n=2,050
Q3. Which of the following actions would you take first if you thought you were having a heart attack or stroke? Please select one answer. “Call 911” was one of ten answer options.
Q5. To what extent do you agree or disagree with each of the following statements? 4-point agree-disagree scale

Non-Hispanic Blacks and Hispanics are significantly more worried about getting infected at the hospital compared with non-Hispanic Whites.
## Urbanicity

Respondents who live in urban or rural settings would be significantly less likely to call 911 if they thought they were having a heart attack or stroke compared with those in the suburbs. Those in urban settings are significantly more worried about getting infected at the hospital. They are also significantly less likely to believe they would receive the same quality of care as others.
